Lean Data Migration service

Securely and safely transfer your data to your new application(s)

DATA TO VALUE

Data Migration is something that many IT departments and operational users of data unnecessarily dread. Transferring data is often error prone, expensive, time consuming and requires a major project. Frequently this leads to data quality, integrity, governance and modelling issues being carried over to new platforms and valuable historical and audit data being lost.

Data to Value have extensive experience of migrating complex datasets from a variety of sources to new platforms with the latest Data Science approaches. Using discovery and prototyping techniques we can rapidly and safely migrate your data from your existing sources to your new application(s).

Data to Value
We are a Data consultancy that specialise in applying the latest Data Science and Big Data techniques to help organisations understand and mitigate their data risks.

Our **Lean Data Migration service** enables clients to rapidly and safely document, understand and transfer their data to new repositories.

Our solution
Through profiling and discovery techniques we intimately understand your data enabling a smooth and risk-free migration

Here's how we do it:
We use the latest NoSQL Data Science tools and techniques to profile your data sets and identify typical features and atypical features such as defects, modelling issues and data quality problems.

Solutions are prototyped for users to interactively test prior to expensive and time consuming production work. Feedback is incorporated into a build-measure-learn cycle.

Final production migration and testing can be carried out in parallel, iteratively or via batches following successful testing and user signoff

We work with all data formats and storage technologies, including legacy components:

We provide you with interactive dashboards and actionable intelligence:

Understand your data quality and modelling issues before costly production and testing work commences

Migrate all of your valuable data including metadata, historical and audit data

Prototype and test new data structures and models as part of an agile migration process

Prevent referential integrity issues, defects, orphaned data and unusual patterns
